

PR0682 Modular Hip

As an alternative to cadaver trainings, SYNBONE has developed a sophisticated hip replacement modular leg. This fully functional hip joint model has realistic skin, muscle structures, nerve structures, acetabulum and femur (including capsule). The stand can be fixed to a table with an easy to handle locking mechanism. Training can be performed through either anterior or anterior lateral access. The construction simulates the movements required during surgery (i.e. adduction, extension and rotation of the upper limb).

The muscle material is durable and can be ordered as a spare part as required for your training. The femur, with capsule, is easily replaced by unfastening two screws. No additional tools are required.

The following replacement parts are available:

- PR0682.60 Modular Hip, Bone Set
- PR0682.20 Modular Hip, Muscle, anterior group
- PR0682.21 Modular Hip, Muscle, posterior group
- PR0682.22 Modular Hip, Muscle, gluteus maximus
- PR0682.70 Modular Hip, Skin
